

FINKA

Enhancement of the biodiversity of insects in arable farming by
reducing synthetic herbicides and insecticides

10.11.2023

Hans Tüllmann, Kompetenzzentrum Ökolandbau Niedersachsen

Das Finka-Projekt wird gefördert von:

leben.natur.vielfalt
das Bundesprogramm

Bundesministerium
für Umwelt, Naturschutz, nukleare Sicherheit
und Verbraucherschutz

Bundesamt für
Naturschutz

Weitere Unterstützer:

Niedersachsen

Overview of the FINKA-Farms

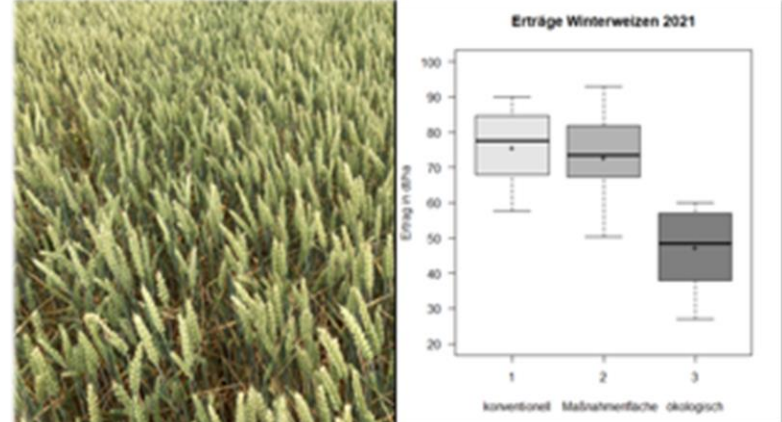

- 60 farms in Lower Saxony
- Duration 5 years
- Project based on a Partnership: conventional farmer + organic farmer = **Farm-couple**
- Cooperation & knowledge transfer (farmers, advisors, coaches, companies)

Insects & accompanying vegetation
→ Ecological evaluation of the actions

Returns, costs and contribution margin
→ Economic evaluation of actions

Research on insect diversity

- What's the effect of reducing/banning synthetic insecticides and herbicides on the diversity of insects?

Flytraps

Nesting boxes

Ground traps

Evaluation

Picture: Brauckhoff/Landvolk

Research on accompanying field flora

Whats the effect of reducing synthetic herbicides and insecticides on the accompanying field flora?

Picture: Brauckhoff/Landvolk

Picture: Tempel/NAN

Economical evaluation

What's the **economical effect** in each variation?

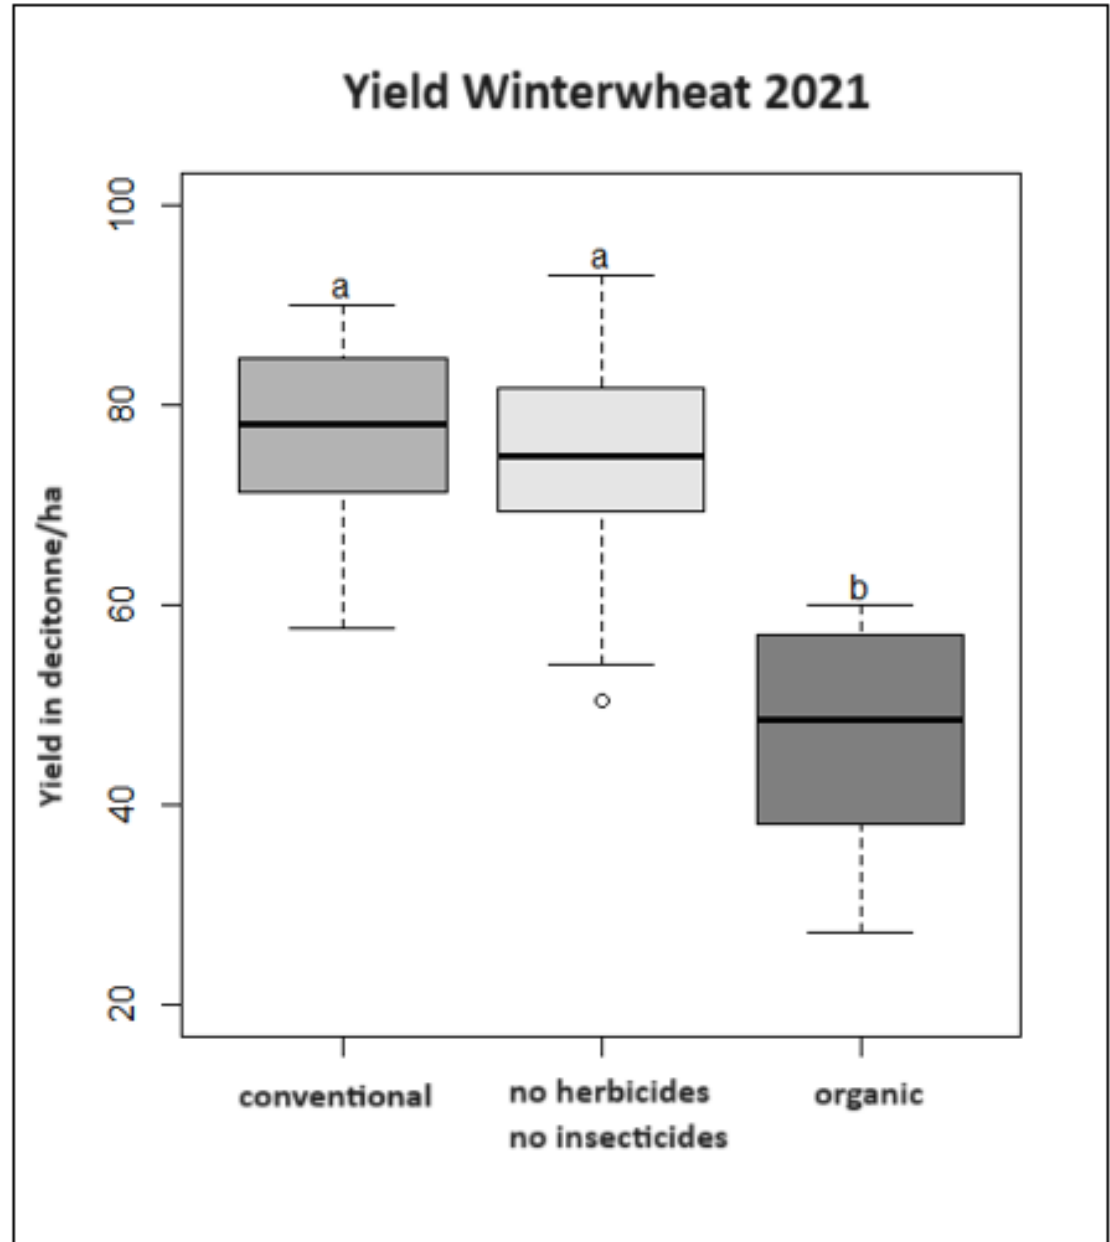

- Collection of data regarding yield, revenue and costs
- Saving potential regarding pesticides
- Variation in labour costs
- Contribution margin of each culture in each variation

Yield 2021 – Winterwheat

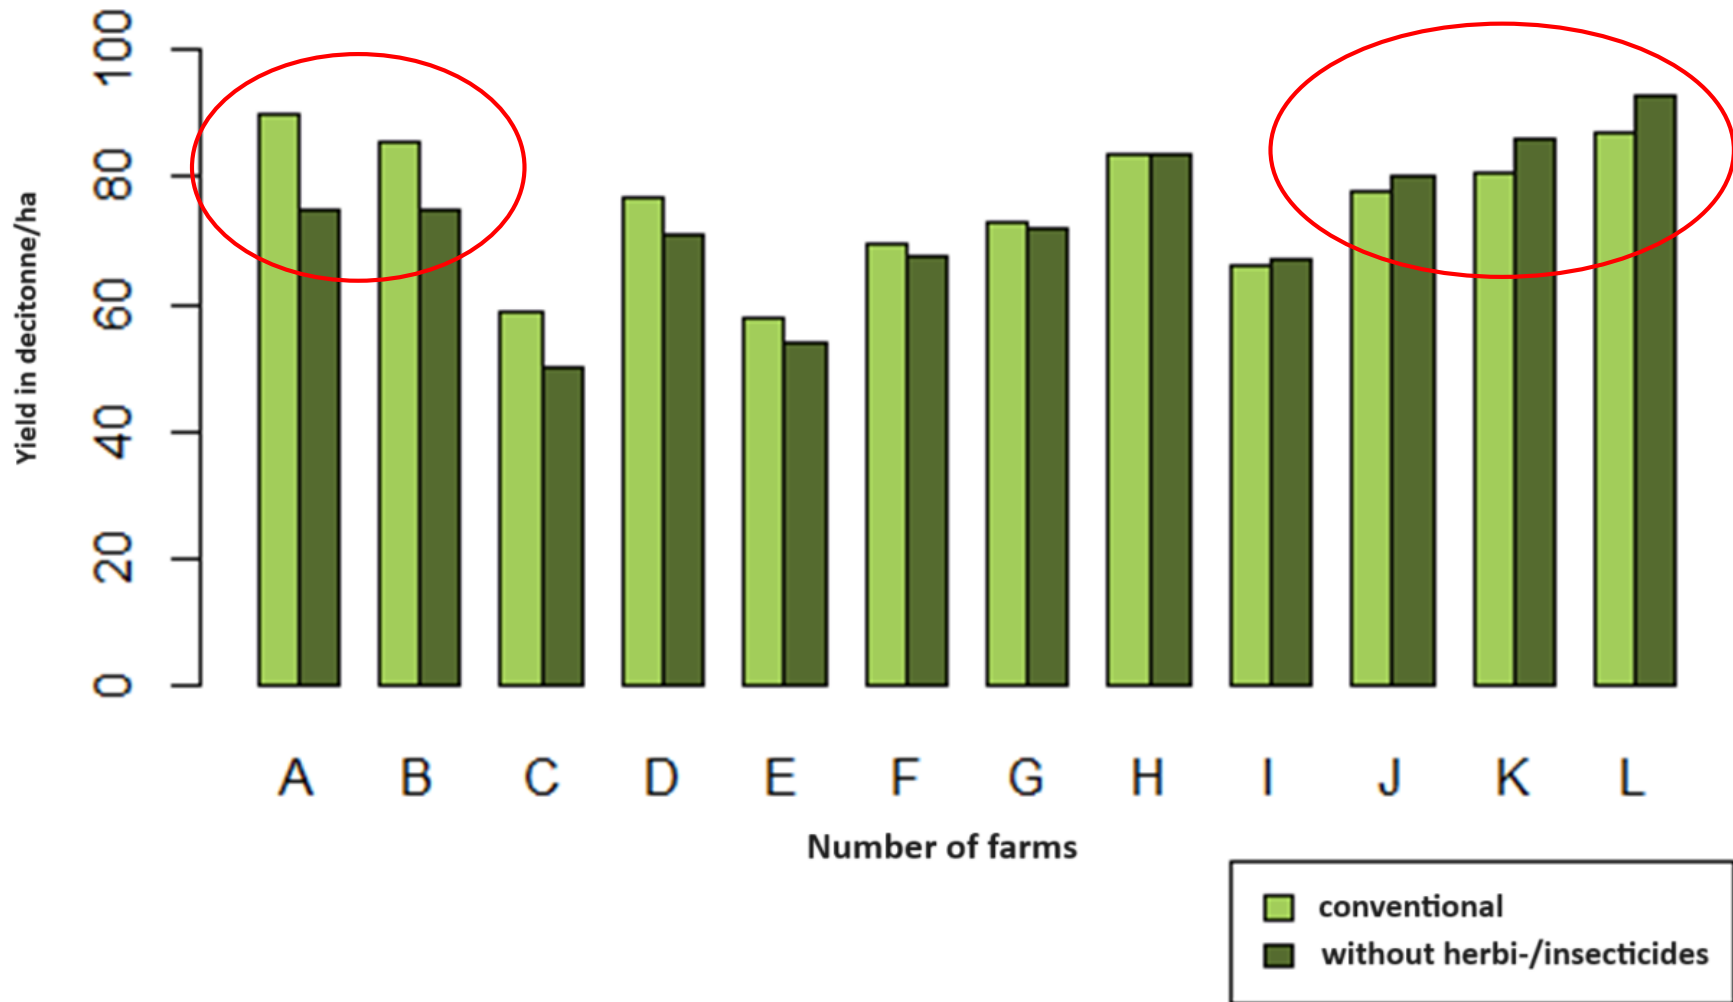

Results from first year! No Significance!

Picture: NAN

Difference in Yield Winterwheat 2021

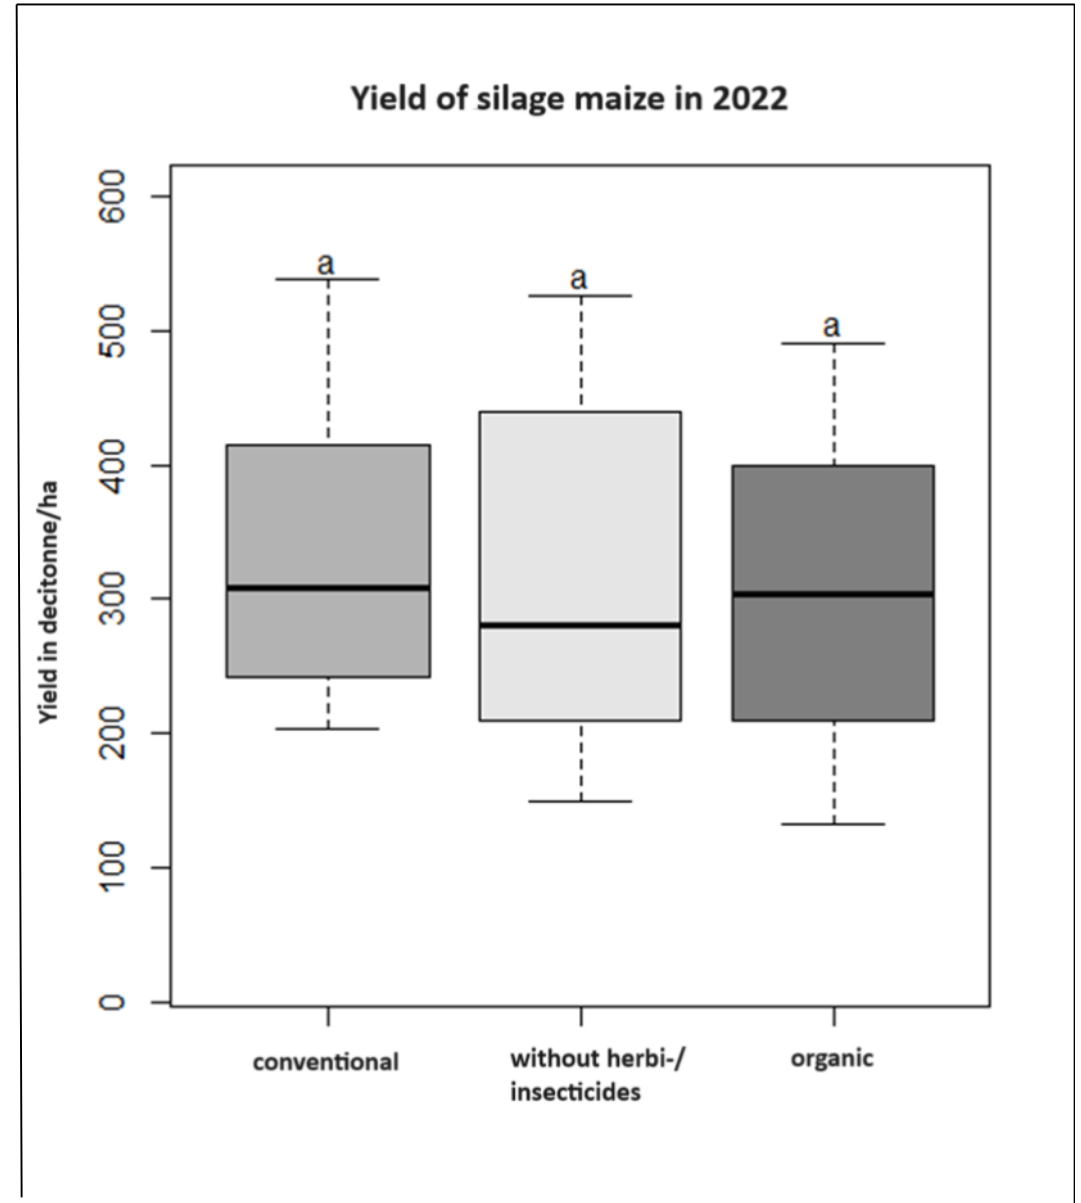

Graphic: Tempel/NAN

Yield 2022 – Silage maize

Results from first year! No Significance!

Results depend massively on the crop

- How high is the risk?
- Stability of the crop?
- Cost-efficiency (labour)
- Pesticide-intensity?

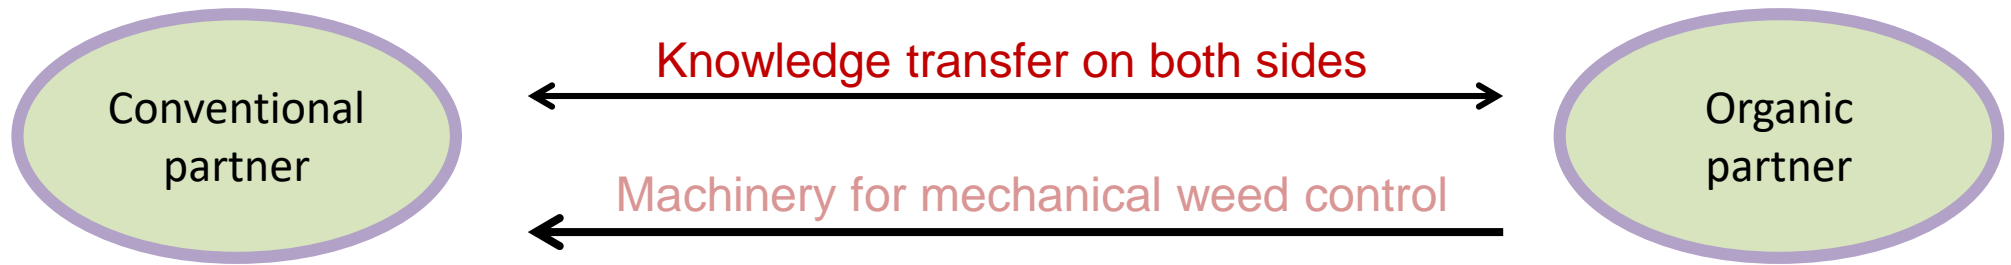

Preliminary results for the accompanying field flora 2021 – Winterwheat

Results from first year! No Significance!

FINKA – it's a communication project!

Meeting with partner, advisors
& colleagues

Networking with all FINKA-
farmers

Field schools and seminars

Space for discussion

Support of insects

- Why do we need insects?
- What environment do insects need?
- What can farmers do to enhance the biodiversity of insects?

Successful implementation of a reduction strategy

- Crop rotation
- Crop varieties
- Sowing time
- Mechanical weed control

Several meetings at FINKA-Sites

Thank you very much for your attention

Befragung im Projekt teilnehmender konventionell wirtschaftender Betriebe

Motivation

- Resistenzen unerwünschter Kräuter und Gräser
- Forderungen der Politik und öffentliches Interesse
- Interesse am Ausprobieren/Kennenlernen alternativer Bewirtschaftungsmethoden
- Austausch untereinander
- Neugier an wissenschaftlichen Ergebnissen
- Insektensterben

Hindernisse

- Teilweise Rücksprache mit Verpächtern notwendig
- Akzeptanz für Ackerbegleitflora (LandwirtInnen + Bevölkerung)

Vorläufige Ergebnisse zur Ackerbegleitflora 2021 – Wintergetreide

Untersuchungen der Ackerbegleitflora 2022

- 2022 und 2023 verschiedenste Kulturen auf den FINKA-Flächen
- Große Unterschiede je nach Standort und Kultur!
